TWIN AIR

decentralized double-flow counter-current heat recovery unit

Product informations

The new decentralized counter-flow dual-stream heat recovery unit is equipped with an enthalpy exchanger featuring a polymer membrane capable of recovering heat and humidity, preventing the air from becoming dry. Furthermore, thanks to its 5 available speed settings, including night mode, air exchange can be adjusted to suit different situations. Thanks to Turbo mode, speed can increase by up to 15% to ensure even higher performance. The family achieves up to 89% efficiency, a value referring to the night speed of the TWIN AIR 50 and TWIN AIR 100 models.

The core of the product is protected by two dedicated filters that also improve indoor air quality by removing pollutants such as pollen and fine particulate matter.

The new high-efficiency heat recovery unit is designed for seamless integration with the architecture; in fact, the semi-recessed installation reduces the visual impact to a mere 6 cm of protrusion. Furthermore, it can be installed either vertically or horizontally.

- Enthalpy exchanger
- IPX4 protection grade
- Integrated humidity and temperature sensors
- Ultra quiet
- Double washable dust filter
- Up to 89% efficiency
- No condensate drainage is required

TWIN AIR
