LEVEL INDICATOR WITH PIN SEAL

Equipped with PN 10 pin lock with male connection

Product informations

Level indicator generally installed outside tanks, or in any container requiring inspection of the level of the liquid contained in it, so as to intervene if necessary with the appropriate filling; its operation is very simple and uses the principle of communicating vessels, in this way the reading of the level is absolutely faithful to the real level of liquid present in the tank.

Product features

- to fulfill the function for which the level indicator is built, the pipe used to display the liquid level must be transparent
- it is made up of two parts: an upper one which performs the function of intercepting the liquid, connected to a transparent pipe and a lower one which, in addition to intercepting the liquid and connecting it to the aforementioned pipe, includes a tap for discharging the liquid contained in the tube
- its pin closure allows you to isolate the transparent tube to make a quick replacement in case of breakdowns, while the tap located in the lower part of the pair of indicators has the function of draining the liquid still present in the transparent pipe

Technical Features

MAX WORKING PRESSURE	10 BAR
MAX WORKING TEMPERATURE	80°C
