PRESSURE REDUCER FOR WATER

With piston operation

Product informations

Automatic valve that reduces and stabilizes the pressure of a fluid inside a distribution pipe according to the pre-set value; the use of this hydraulic device is necessary if the maximum possible pressure at any point of the water supply system can reach or exceed the relative maximum permissible operating pressure.

Product features

- suitable for water supply systems both outside and inside buildings
- the internal piston structure in loaded thermoplastic material guarantees rigidity, resistance and high adjustment precision, thanks to the compensated seat
- its gaskets with a low coefficient of static friction guarantee resistance to wear and limited maintenance interventions
- the internal finish of the body and the increased dimensions of the passages allow to obtain high flow rates even with small water withdrawals
- it can be installed on sanitary systems for water supply, irrigation systems, compressed air distribution systems (no nebulized oils) and on pipes for firefighting services
- suitable for transporting food fluids and drinking water (meets the specific requirements of the Ministry of Health)
- connection with female-female union included
