## SAFETY VALVES MOD. VIC

Positive action

### Product informations

Valves not activated by external energy, built in order to intercept the flow of fuel to the burner to prevent the temperature of the water in the system delivery circuit from reaching the burner temperature.

*The valve is closed by:*

- drilling or cutting of the capillary and/or the sensor bulb, being positive action valves in this case it is not possible to reactivate the valve
- raising the water temperature until reaching the calibration point of 98°C (+ 0 - 5°C), in this case it is possible to reactivate the valve only if the temperature drops to at least 87°C ± 2°C
